preface

This manual is used to familiarise you with safety, assembly, operation, adjustment, troubleshooting, and maintenance. Read and follow the recommendations in this manual to ensure safe and efficient operation.

We want you to be completely satisfied with your new product, feel free to contact your local authorized service dealer for help with service, replacement parts, or any other information you may require. If you need assistance in locating a dealer, visit our web site at www.dcpuk.com or call customer service at +44 (0) 1908 240300.

Whenever you contact your authorised service dealer, always have the model number and serial number of your product available. These numbers will help provide exact information about your specific product. You will find the model and serial numbers on an ID plate located on the product.

The descriptions and specifications in this manual are subject to change without notice. Dawson reserves the right to improve products. Some product improvements may have taken place after this manual was printed.

introduction

This robust pile lifting shackle was contractor designed and developed over many years of site use and abuse. The use of these shackles compliments the "Feet on the Ground" approach to piling. When used in conjunction with the Sheet Pile Threader, there is no need for site operatives to go above the safety of top frame level for interlocking sheet piles or releasing the lifting shackles. The shackles are suitable for lifting all steel piles up to 28mm thick and within the safe working load of the shackle. The shackle is stiffened to resist spreading of the forks when lifting at 90° to the axis of the pile. (See "Safety Check List"). When lifting sheet piles in pairs or individual piles weighing more than the Safe Working Load of the shackle, it is necessary to use multiple shackles in order to keep within the safe working load. Pairs of shackles can be supplied mounted on a two legged steel wire rope sling. The advantage being that the standard pair of shackles with lifting sling can be fitted to any pair of Larssen 'U' piles. Frodingham 'Z' piles, pipe or box piles. No additional parts or change of components is necessary. The ring at the top of the sling can be hooked directly onto a standard crane hook block, 'D' shackle or fork anchor. Shackles can also be fitted onto a solid steel cross head according to customers requirements.

FEATURES

- Robust High Strength cast steel body. High alloy steel plunger.
- Plunger mechanism concealed for maximum protection.
- Plunger mechanism easily detachable for maintenance.
- Heavy web stiffening to withstand side left (i.e. 90° to the axis) imposed when lifting piles from a stack. (See "Safety Check List" for correct working practice).
- Lifting ring at top of shackle to enable lifting from a variety
- of angles.
- Proof loading to twice the safe working load.
- Indicator bar to give clear visual indication that plunger has engaged pile lifting hole completely.
- Shackle throat depth available in two sizes: 150mm (6") or 250mm (10") to suit all usual lifting hole positions.
- Quick coupling and release of shackle from piles ensuring maximum productivity.
- 'Safety ring' to protect against accidental plunger release caused by poor working practices.

method of operation

1. Tie a length of soft rope to the pull ring on the pull wire. The rope should be 1 metre (3 feet) longer than the pile length. Do not use a continuous loop as this will become snagged.

2. Before positioning the lifting shackles, it is necessary to retract the plunger. Pull the pull wire until the trip mechanism holds the plunger in its retracted position.

3. Separate the sheet piles on the stack to enable the body of shackle to be slid over the pile head. With the plunger tube assembly uppermost, slide the fork of the shackle over the pile head with the pile in the throat of the shackle.

4. With the plunger over the pile lifting hole, firmly tap the indicator bar end. If the plunger does not locate directly through the hole, move the shackle body until the plunger goes through the pile hole and into the shackle body on the underside. The indicator bar should be flush with the plunger tube assembly.

5. Repeat this for both piles when lifting pairs of sheets.

6. Install the safety ring over the plunger tube assembly as shown in the installation diagram.

7. With the plunger properly located, the safety ring engaged, the piles can then be lifted into position for threading. It is advisable to tie the shackle ropes to the sheet pile threader to prevent them being trapped, snagged or getting blown out of reach in strong winds.

8. To release the shackles after threading is complete, the safety ring must first be unhitched by 'flicking' the release rope, then simply pull on the release rope. If there is a tendency to jam, then take the weight of the shackle on the crane and pull again.

9. Unauthorised alterations invalidate the test certificate.

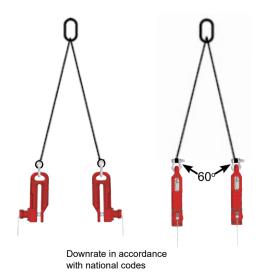

lifting piles correctly

LIFTING PAIRS OF PILES

When lifting sheet piles in pairs it is necessary to use a pair of shackles.

The ring at the top of the sling can be hooked directly onto a standard crane hook block, D shackle or fork anchor. The sling also enables the shackles to be turned to fit opposite faces of box or tube piles using the standard sling and shackles.

Shackles can also be fitted onto a solid steel cross head according to customers requirements.

safety check list

1) PRE-INSTALLATION CHECKS

Prior to installing a shackle onto any steelwork, check the following:

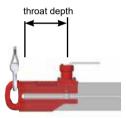

a. Establish the weight of the lift involved and ensure a shackle with appropriate Safe Working Load is being used.

b. Ensure the lifting hole is at the correct distance from the top of the steelwork.

i.e. 150mm for a 150mm throat depth shackle, 250mm for a 250mm throat depth shackle or 300mm for a 300mm throat depth shackle.

Incorrect hole placement in steelwork may cause shackle failure!

c. The lifting hole should be neatly drilled or punched and of a suitable size to suit the plunger.

d. The Safe Working Load rating of any shackle is based on a purely tensile (axial) load. When lifting steelwork from horizontal to vertical or the reverse, remember that the shackle becomes de-rated by 50%.

i.e. a 10 tonne S.W.L. Ratchet Shackle should only be loaded to 5 tonne at the start of a horizontal lift.

continued - safety check list

2) Do not use the lifting shackles for pulling or extracting.

3) Ensure that the pin has gone through both sides of the shackle body - check indicator bar position prior to lifting.

4) Do not modify the lifting shackles or any part of the lifting apparatus. Keep the burning torch well clear!

5) Keep the plunger mechanism well lubricated.

6) Care should be taken to avoid the pull ropes getting snagged.

7) The angle between the two legs of the lifting strap, where applicable should not exceed 90°.

8) Ensure that all appropriate laws, bye-laws and regulations are complied with.

9) Always use the safety ring to prevent accidental release.

- it only takes an extra second or two!

KEEP FINGERS OUT OF THE SHACKLE THROAT AT ALL TIMES. (GLOVES SHOULD BE WORN.)

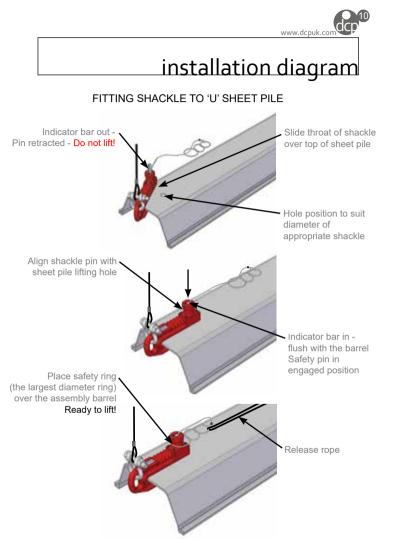

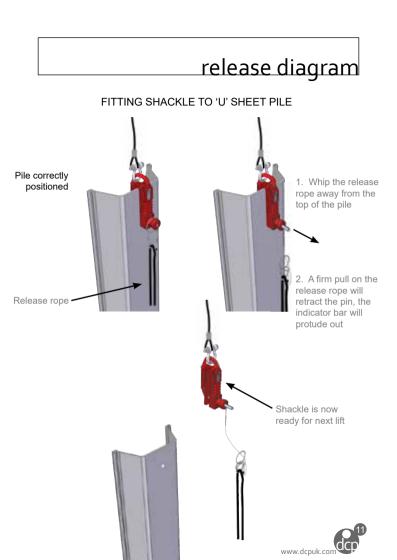

DO NOT USE SHACKLE IN TEMPERATURES BELOW -15°C (5°F) CONSULT MANUFACTURE FOR FURTHER INFORMATION ON LOW TEMPERATURE SOLUTIONS.

SHACKLES MUST NOT BE SUBJECTED TO EXCESS VIBRATION FROM PLANT EQUIPMENT.

training

Before allowing operators to use the Shackle, it is important to ensure they have received basic training in lifting and control of heavy loads.

It is strongly recommended that the following areas are covered:

- 1. Basic safety in lifting operations
- 2. Supervision during lifting operations
- 3. Detailed instruction on how the Euro Shackle operates
- 4. Safety Features of the Euro Shackle
- 5. Dangers and Mal-practices
- 6. Correct choice of Euro shackle for the job

maintenance

The Shackle is manufactured from high quality material and assembled in a manner designed to offer long service with a minimum of maintenance.

In order to preserve the product in this state, it is necessary to ensure that it is not mis-used or used for purposes outside its recommended use and to carry out regular inspection and servicing.

The shackle body should be checked regularly for distortion arising from overload - if bent - bin. The pin should be checked for smooth travel and light oiling applied at moving surfaces.

If the product does not operate perfectly, contact the manufacturer for advice, or return for immediate attention.

Each unit is issued with a test certificate.

If any parts of the shackle are replaced with non standard parts or in a non approved manner, the certificate is no longer valid.

Replacement of any load bearing components requires a re-test to twice safe working load.

A GUIDE TO CHANGING THE PULL WIRE ON A DAWSON GROUND RELEASE SHACKLE

DAWSON CONSTRUCTION PLANT LTD. CHESNEY WOLD, BLEAK HALL MILTON KEYNES MK6 1NE, ENGLAND TEL: +44 (0) 1908 240320 FAX: +44 (0) 1908 240322 EMAIL: JONGDCPUK.COM

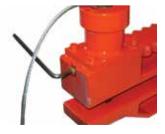

The Pull Wire may require changing if it is frayed, kinked or generally damaged.

02

First remove the guide key. Unscrew the M6 cap head screw and washer.

03 The guide key can now be retracted.

04

Remove the plug from the underside of the shackle body. The detent pin can be left in the shackle body.

Remove the 4 No. M8 cap head screws holding the tube assembly to the shackle body.

06

Carefully retract the assembly from the body as shown.

07

The sleeve is attached to the plunger via a coiled pin. This needs to be removed. Hold the sleeve securely.

Drive the coiled pin out using a 5mm punch.

REMEMBER TO WEAR EYE PROTECTION!!!

With the sleeve removed the old Pull Wire can be extracted.

09 Important

The new Pull Wire tail must be threaded through the largest ring to ensure correct orientation at final assembly.

10

Thread the tail of the new Pull Wire into position.

11

Locate tail end in plunger in the oval slot as shown.

The sleeve can now be replaced and coiled pin hammered back in place. A new coiled pin may be required if the old one is damaged.

HINT: Ensure the coiled pin is flush on both sides of the sleeve, this will allow smooth operation in the shackle body.

13

The assembly can now be reattached to the shackle body. A small amount of force is required to push the assembly against the spring to the shackle body.

Tighten the 4 No. M8 cap heads.

14

The plug and guide key can now be reinserted and tightened into position. The guide key M6 cap head should have a light coating of Loctite 270 applied.

Finally check correct operation of the mechanism.

Gloves should be worn for these operations!

First operate the Pull Wire to retract the plunger. This requires reasonable force. The plunger should remain in the retracted position.

16

A tap with a soft hammer should fire the pin forward.

17

The indicator bar (item just hit with the hammer) should be flush to the tube assembly as shown – this is critical! If in doubt, contact the manufacturer. www.dcpuk.com
